

Pump sets

The heart of every machine.

The pump set is the heart of every machine. These pump sets are carefully composed from quality components and are known for their durability. We can deliver a suitable pump set for everyone. If the standard pump sets are not sufficient, we can let them built especially for you.

Pump sets with fuel engine

Pump sets with a fuel engine are standard equipped with a Honda petrol engine. This is equipped with a minimum oil protection and hand starter. Small capacity diaphragm pumps are directly driven using a delay box, this makes this set very compact to build. For larger capacities and plunger pumps, the structure is the same as that of the pump sets with electric motor.

Pump sets with electric motor

Pump sets with electric motor are usually driven by a v-belt. A protective cover protects the drive. These sets are equipped with an automatic tensioner, to easily tension the v-belt. The sets are equipped with of a switch with thermal protection. You have the choice for a plunger or diaphragm pump in combination with a 230 or 400V motor. Depending on the type of electric motor, the set is supplied with 10 meter cable with plug or with a socket and plug.

For spraying with high and low pressure, a pump set has been developed with a double regulator. One regulator to set low pressure for example for spraying of pesticides and one regulator to set high pressure. Because of a three-way valve, it is possible to switch between high and low pressure.

All pump sets are supplied with 2 meter suction and return hose and a suction basket. Standard pump sets are suitable to build on most of our spray trucks.
